NovaCloud Product Guide v4.2

NovaCloud Overview

NovaCloud is TechNova's data pipeline platform. It lets teams build, schedule and monitor pipelines that move data between databases, object storage and SaaS applications, without managing servers.

The platform has three parts: the Pipeline Builder, the Scheduler and the Observability Hub. The current release is NovaCloud 4.2, shipped in February 2024.

Pipeline Builder

The Pipeline Builder is a visual editor where a pipeline is assembled from connectors, transforms and destinations. Every pipeline can also be exported as a YAML file and stored in Git.

Transforms are written in SQL or Python. Python transforms run in an isolated sandbox with a 10 minute execution limit and 4 GB of memory.

Scheduler

Pipelines can run on a fixed schedule using cron expressions, on an event trigger such as a new file landing in object storage, or on demand through the REST API.

Failed runs are retried three times with exponential backoff. After the third failure the pipeline is marked as failed and an alert is sent to the configured notification channel.

Observability Hub

The Observability Hub shows run history, row counts, execution time and data quality checks for every pipeline. Metrics are retained for 13 months on all paid plans.

Data quality checks include null checks, uniqueness checks, range checks and freshness checks. A failing check can either warn or stop the pipeline, depending on how it is configured.

Connectors

NovaCloud 4.2 ships with 68 connectors, including PostgreSQL, MySQL, Snowflake, BigQuery, Amazon S3, Google Cloud Storage, Salesforce, HubSpot, Stripe and Zendesk.

Customers can build private connectors with the Connector SDK. A private connector is visible only inside the customer's workspace and is not reviewed by TechNova.

Pricing Tiers

NovaCloud has three subscription tiers. Starter costs 99 USD per month and includes 3 pipelines, 1 workspace and 10 GB of monthly data transfer.

Growth costs 499 USD per month and includes 25 pipelines, 3 workspaces and 250 GB of monthly data transfer. Enterprise is priced per contract and includes unlimited pipelines, unlimited workspaces, single sign-on and a private deployment option.

Data transfer above the included allowance is billed at 0.09 USD per GB. Usage is measured per calendar month and shown live in the Billing page.

Platform Limits

A single pipeline may contain up to 150 steps. The maximum size of one file processed in a single step is 5 GB. The REST API is rate limited to 600 requests per minute per workspace.

Limits can be raised for Enterprise customers by contacting the Technical Account Manager.

Integrations and Alerting

Alerts can be delivered to email, Slack, Microsoft Teams, PagerDuty and any HTTPS webhook. Each pipeline can have its own alerting rules.

NovaCloud also exposes a Prometheus-compatible metrics endpoint so customers can pull pipeline metrics into their own monitoring stack.

Getting Started

After signing up, create a workspace, connect a source, choose a destination and run the pipeline once manually. The guided tutorial in the console walks through this in about 15 minutes.

Free trials last 14 days and include all Growth tier features. No credit card is required to start a trial.

Deprecation and Versioning

The NovaCloud REST API is versioned. Version v1 is deprecated and will be switched off on 31 December 2024. Version v2 is the current, supported version.

TechNova gives at least 12 months notice before removing an API version, and 6 months notice before removing a connector.
